THE PROJECT

INFINITY aims to transform the traditional approach to criminal investigation and analysis using immersive and collaborative environments. The INFINITY concept is based on four core research and technical innovations that together will provide a revolutionary framework for converting data into actionable intelligence.

Infinity's ***Immersive Investigative and Collaborative Environment (I3CE)*** provides law enforcement with methods and tools to prevent, detect, analyse, and combat criminal activity more quickly and successfully by improving shared situational awareness and decision making. Ultimately, these capabilities will drive a paradigm shift in the ability of EU member states to **combat cybercrime and terrorism** while implementing governance processes to maintain **full compliance with fundamental rights and protect privacy and personal data**.

STATUS

As experts in collaborative work environments in virtual reality, Manzalab will lead the work of Work Package 4 aimed at providing the virtual environment and the tools allowing remote people to meet, interact and communicate by sharing information (text files, 2D and 360° images, 2D and 360° videos, 3D models). These developments are complemented by web-based tools allowing to manage access and user rights.
